No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This DNA sequence codes for thermostable esterase SNP6-24LC (W23070) CC of Archaeoglobus venificus SNP6, an isolate which grows optimally CC at 75 deg C and pH 6.9. It can be amplified from a pBluescript CC vector by PCR (see T79303-05). Claimed, newly identified CC vector by PCR (see T79303-05). Claimed, newly identified CC vector by PCR (see T79303-05). Claimed, newly identified CC polynucleotides (T79321-30) encoding esterases (W23069-77, W23088) CC vere recombinant production of the enzymes in host cells, and as probes CC to identify related sequences. The esterases are stable at high ctemperature and in organic solvents, making them superior for use in production of pure chiral compounds used in pharmaceutical. CC agricultural and other chemical industries. A method is claimed CC for transferring an amino group from an amino acid to an alpha-keto CC acid using a claimed esterase. The enzymes may also be useful as CC ripening starters in cheese making, in lighth removal in paper and CC pulp manufacture, in carbohydrate derivative synthesis, in the Study of plant wall structure, plant resistance to disease and CC organic matter decomposition and to select plants bred for production of highly degradable animal feeds.

z97019 to z97137 represent 94 isolated human secreted protein genes Y86215 to Y86333 are the secreted proteins encoded by the 94 human This sequence represents a fragment of one of the human secreted proteins. The genes and their corresponding secreted polypeptides a useful for preventing, treating or ameliorating medical conditions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; secreted protein; cancer; tumour; developmental abnormality; foetal deficiency; blood disorder; immune system disorder; inflammation; autoimmune disease; allergy; Alzheimer's disease; cognitive disorder; schizophrenia; arthritis; asthma; psoriasis; sepsis; skin disorder; atherosclerosis; diabetes; cardiovascular disorder; kidney disorder;
                                                                                                                                                                              New isolated human genes and the secreted polypeptides they encode, useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         digestive disorder; endocrine disorder; infection; AIDS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                e.g., by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 94 genes, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, autoimmune diseases, inflammation, allergies, Alzheimer's and cognitive disorders, schizophrenia, arthritis, asthma, psoriasis, sepsis, skin disorders, atherosclerosis, diabetes, cardiovascular disorders, kidney disorders, digestive/endocrine disorders, infections and AIDS. The polypeptides are also useful for identifying their binding partners. The sequences shown in Y86334 to Y86585 represent fragments of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Either of two 3' PCR primers (T79304 and T79305) can be used with a 5' PCR primer (T79303) to amplify the esterase SNP6-24LC gene (see T79323) of Archaeoglobus venificus SNP6 from a pBluescript vector containing the DNA. The amplified sequence can then be inserted into a pQET vector, and the esterase (see W23070) expressed in bacterial host cells. Novel esterases (see W23070) are provided that are stable at high temperature and in organic solvents, making them superior for use in production of pure chiral compounds used in the pharmaceutical, agricultural and other chemical industries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid encoding heat stable esterase from thermophilic bacteria - which is active in organic solvents, useful in cheese paper manufacture, and to study plant resistance to disease

Either of two 3' PCR primers (T79304 and T79305) can be used with a 5' PCR primer (T79303) to amplify the esterase SNP6-24LC gene (see T79323) of Archaeoglobus venificus SNP6 from a pBluescript vector containing the DNA. The amplified sequence can then be inserted
                                                                                                                                                       Callen |

Rioux C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  into a pQET vector, and the esterase (see W23070) expressed in bacterial host cells. Novel esterases (see W23069-88) are provided that are stable at high temperature and in organic solvents, making them superior for use in production of pure chiral compounds used in the pharmaceutical, agricultural and other chemical industries.
                                                                                                                                                                                                                                                                          CDS

The GBS antigens of the invention can be used as vaccine components for the treatment or prophylaxis of diseases and symptoms mediated by Streptococcus infection, especially group A Streptococcus (S. pyogenes), GBS or S. agalactiae, S. dysgalactiae, S. uberis, S. nocardia, as well as Staphylococcus aureus. The vaccines are administered to those individuals at risk of GBS infection, particularly pregnant women and infants for sepsis, meningitis, and pneumonia, as well as immunocompromised individuals, such as those with diabetes, liver disease or cancer. The vaccines also have vetinary applications, such as for the treatment of mastitis in cattle. The present sequence represents a DNA encoding 5

The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent ski aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The proteins can also be used as a food additive or preservative to increase or decrease storage capabilities. C59729 to C59737 and B34576 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immunosuppressive; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; notropic; neuroprotective; antibacterial; virucide; fungicide; and ophthalmological. The polynucleotides and proteins can be are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases, hyperpoliferative disorders e.g. neoplasms and cancers of the breast or liver, cardiovascular disorders, cerebrovascular disorders,

This nucleotide sequence comprises tomato cv. UC62B 2All genomic DNA cloned into pCGN1273 from the XhoI site (position 1 at the 5' end) to the EcoRI site (position 4654). 2All genomic DNA was obtained by hybridisation using 2All cDNA (see V36971) as probe. 2All has been characterised as a fruit-specific gene. The 2All gene promoter can be incorporated into an expression cassette and used in a novel method for producing a plant with a regulatable phenotype. In this method, regulatory regions from plant genes expressed during a particular developmental stage or in a specific tissue are identified by cDNA screening. The regulatory regions (a T-DNA and Ti or Ri plasmids) are manipulated for use with foreign
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 31-JUL-1986;

                         sequences for introduction into plant cells to provide transformed plants having a phenotypic property that can be modulated. The invention is exemplified with light, seed and fruit-specific promoters. Also claimed are methods for altering the phenotype of fruit tissue as distinct from other plant tissue, modifying the genotype of a plant to impart a desired characteristic to fruit, modifying transcription in fruit tissue, and expressing a heterologous DNA sequence of interest specifically in fruit tissue. The method provides transformation without gall formation in plants which have historically not been Agrobacterium hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Transformation of plants - with regulatory sequence containing constructs for tissue specific expression of genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      P-PSDB; W59610

V27949
                                                           This nucleotide sequence comprises tomato cv. UC82B 2A11 genomic CDNA cloned into pCGN1273 from the XhoI site (position 1 at the 5'CDNA cloned into pCGN1273 from the XhoI site (position 1 at the 5'CDNA cloned into pCGN1273 from the XhoI site (position 1 at the 5'CDNA cloned by hybridisation using 2A11 cDNA (see V27948) as probe.

CONTROL 2A11 has been characterised as a fruit-specific gene. The promoter region of the 2A11 gene can be incorporated into an expression cassette and used in a novel method for producing a plant with an altered phenotype. In this method, regulatory regions from genes caspette and used in a novel method, regulatory regions from genes expressed during a particular developmental stage or in a specific cissue are identified by cDNA screening. The regulatory regions are manipulated for use with foreign sequences for introduction into plant cells to provide transformed plants having a phenotypic property that can be modulated. The invention is exemplified with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             28-JUL-1987;

            The present invention describes genetic constructs (I) for transforming plants with a DNA sequence of interest, comprising a promoter from a napin, EA9 or acyl carrier protein gene, a DNA sequence of interest and flanking T-DNA. The constructs can be used for the expression of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelld infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S.aureus DNA sequences contained on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 1; Page 992-996; 3271pp; English.

                                                                                                                                                                    A00010 to A02716 represent polynucleotides isolated from cDNA libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used in diagnosis and prognosis of diseases and disorders (e.g. identification of concerner and the content of concerner correctants of concerner correctants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            15-MAY-1998;
